PP-device

Pneumatic Presser Foot Pressure Regulator

※The photo below shows the W3500P series.

Air-controlled!

Even if the fabric thickness and/or the fabric characteristics change, the presser foot pressure remains **constant** and **as light as possible**, preventing fabric-related trouble, such as **fabric damages!**

Visualization!

You can operate and program this device **with instructions easily and properly**. Therefore, the presser foot pressure appropriate to the fabric can be **reproduced immediately!**

Dramatically increases production and the quality of your products!!

Point 1

Stabilizes and increases the quality of your products!

Unlike the conventional control method for the presser foot pressure, this device is air-controlled. Even if you set a light presser foot pressure, the machine keeps responding to the fabric. Even if the fabric thickness and/or the fabric characteristics changes on **cross seam sections**, or under similar sewing conditions, **the presser foot pressure remains constant and as light as possible**, preventing fabric-related trouble, such as fabric damages. These features contribute dramatically to **stabilizing and increasing the quality** of your products.

Point 3

The top feed dog is also air-controlled!

This feature eliminates seam jamming and/or uneven stitching on cross seam sections, which tend to occur due to the top feed dog pressure.

Patent pending

Point 5

Available for lockstitch and/or zigzag machines!

This regulator can be used for machines you employ that are not manufactured by PEGASUS, such as a lockstitch machine and/or a zigzag machine, contributing to the stabilization and/or increased quality of your sewn products.

※ Contact our agents for more information about sewing machine models manufactured by other sewing machine manufacturers that can employ this regulator.

Point 2

“Visualization” increases production!

Converting the presser foot pressure into numerical form makes it possible to **reproduce** the presser foot pressure appropriate to the fabric **easily and immediately**.

Even if you use stretchy fabrics, extra lightweight fabrics, or similar fabrics, a machine equipped with this device responds to the fabric, drastically decreasing the time required to make adjustments, and **increases production**. Thus, this device is **most suitable for small-lot production of a diverse product mix**.

※ If you employ a digital type display for the pneumatic presser foot pressure regulator, a power supply (DC12V) is necessary.

Point 4

The presser foot pressure described in the specifications is clear!

The presser foot pressure can be converted into numerical form, so maintenance personnel can **easily describe** the presser foot pressure in the specifications. In addition, **the instructions related to the presser foot pressure become clear**. These features **increase production and the quality** of your products!
